

1. Class Diagram

The structural backbone of AstraNotes. Model classes are isolated from view-layer code per NFR-2. The NoteRepository interface is what makes LocalSQLiteRepository and RemoteRepository swappable for FR-7.

Summary. Note is the base entity; SecureNote extends it with the encryption fields required by SEC-1. NoteRepository is the persistence contract — LocalSQLiteRepository is the Phase-1 implementation, RemoteRepository is the slot Cloud Sync plugs into without rewriting callers. NoteService is the only entry point for the View, satisfying NFR-2.

2. Object Diagram

A runtime snapshot showing one user session with one ordinary Note and one SecureNote in flight, plus an active local repository and the pending sync.

Summary. Two notes exist — one TEXT, one SECURE. Only the SECURE note carries encrypted_body. The single LocalSQLiteRepository instance is shared by both NoteService and SyncService, demonstrating that Cloud Sync operates on the same data without bypassing the encryption boundary.
